

36V, Precision Low-Power Instrumentation Amplifier

Features

- Low Offset Voltage: 50 μ V (Max.)
- Low Drift: 0.2 μ V/ $^{\circ}$ C
- Low Input Bias Current: 2nA (Max.)
- Gain Bandwidth Product: 1.5MHz
- Slew Rate: 1.0V/ μ s
- Wide Supply Range: \pm 2.25V ~ \pm 18V
- Low Quiescent Current: 1.0mA
- Unity Gain Stable
- Input Over-Voltage Protection
- Extended Temperature Ranges
From -40 $^{\circ}$ C to +125 $^{\circ}$ C
- Available as SOP8/MSOP8/DIP8

Applications

- Medical Instrumentation
- RTD Sensor Amplifier
- Data Acquisition
- Thermocouple Amplifier
- Bridge Amplifier

General Description

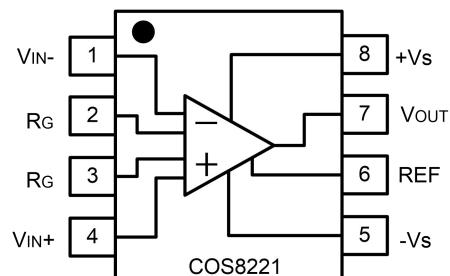

COS8221 is a low-power, general purpose instrumentation amplifiers offering excellent accuracy. The versatile 3-op amp design and small size make these amplifiers ideal for a wide range of applications. A single external resistor sets any gain from 1 to 10,000.

COS8221 is laser-trimmed for very low offset voltage (50 μ V), drift (0.2 μ V/ $^{\circ}$ C) and high common mode rejection. It operates with power supplies as low as \pm 2.25. The quiescent current is only 1.0mA, ideal for battery-operated systems. COS8221 is available in 8-pin plastic SOP8, DIP8 and MSOP8 packages, specified for the -40 °C to +125 °C temperature range.

(1) Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 10mA or less.

4. Application Notes

4.1 Overview

The COS8221 instrumentation amplifier is a type of differential amplifier that has been outfitted with input protection circuit and input buffer amplifiers, which eliminate the need for input impedance matching and make the amplifier particularly suitable for use in measurement and test equipment. Additional characteristics of the COS8221 include a very low DC offset, low drift, low noise, very high open-loop gain, very high common-mode rejection ratio, and very high input impedances.

4.2 Application Information

COS8221 measures small differential voltage with high common-mode voltage developed between the noninverting and inverting input. The ability to set the reference pin to adjust the functionality of the output signal offers additional flexibility that is practical for multiple configurations.

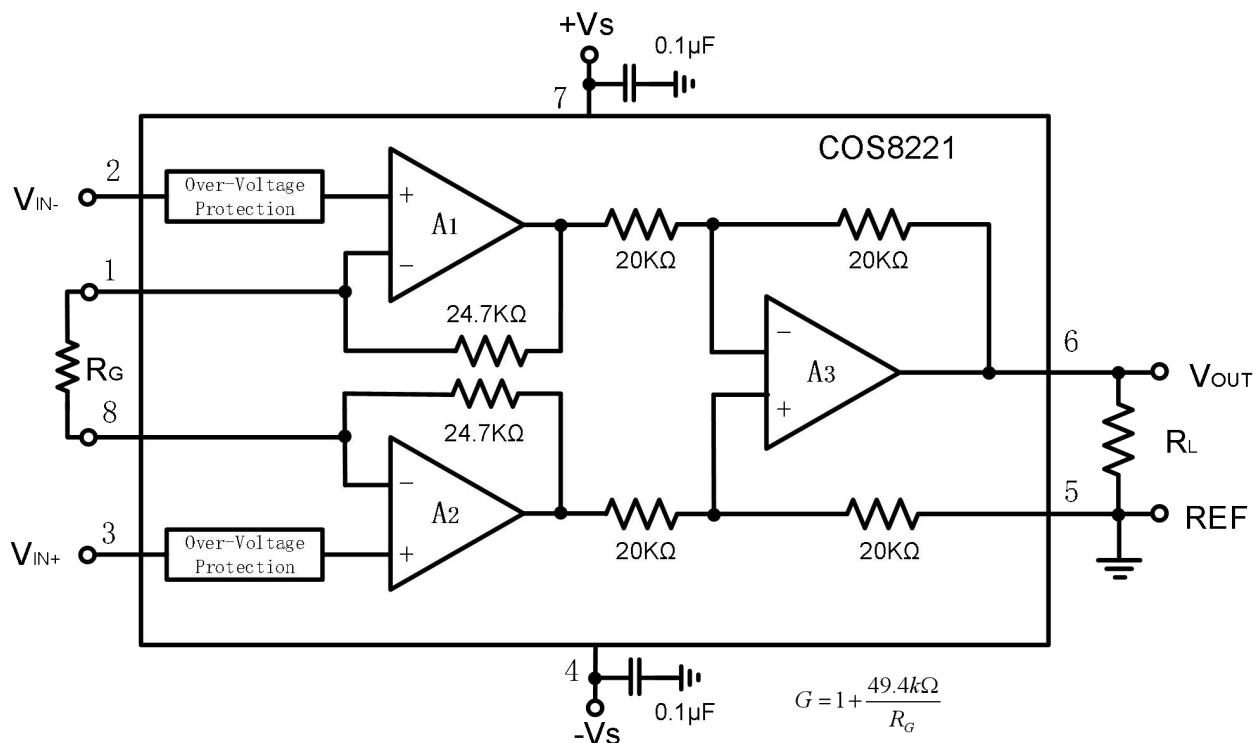

Figure 4.1 Functional Block Diagram and Basic Connections

Figure 4.1 shows the basic connections required for operation of the COS8221. Applications with noisy or high impedance power supplies may require decoupling capacitors close to the device pins as shown. REF pin must be a low-impedance connection to assure good common-mode rejection. A resistance of 8Ω in series with the REF pin will cause a typical device to degrade to approximately 80dB CMR. The voltage a_{in} is set by connecting a single external resistor, R_G , connected between pins 1 and 8:

$$G = 1 + 49.4 \text{ k}\Omega/R_G \quad (1)$$

Commonly used gains and resistor values are shown in Table 4.1.

4.3 Power-Supply Bypassing and Layout

The COS8221 operates from a single +4.5V to +36V supply or dual $\pm 2.25\text{V}$ to $\pm 18\text{V}$ supplies. For single-supply operation, bypass the power supply $+Vs$ with a $0.1\mu\text{F}$ ceramic capacitor which should be placed close to the $+Vs$ pin. For dual-supply operation, both the $+Vs$ and the $-Vs$ supplies should be bypassed to ground with separate $0.1\mu\text{F}$ ceramic capacitors. $2.2\mu\text{F}$ tantalum capacitor can be added for better performance.

The length of the current path is directly proportional to the magnitude of parasitic inductances and thus the high frequency impedance of the path. High speed currents in an inductive ground return create an unwanted voltage noise. Broad ground plane areas will reduce the parasitic inductance. Thus a ground plane layer is important for high speed circuit design.
