

High- and Low-Side Voltage Output, Zero-Drift Current Sense Amplifiers

Features

- High- and Low-Side Measurement
- Wide Common-Mode Range:
-0.3V to +25V
- Power Supply Range: 2.7V to 5.5V
- Low Quiescent Current: 50μA typical
- Low Offset Voltage: ±50μV max
- Low Offset Drift: 0.5μV/°C
- Low Gain Error: 2% max
- Low Gain Error Drift: 10 ppm/°C max
- Rail-to-Rail Output
- Industrial Operation Range:
-40°C to 125°C
- Small Packaging: SOT23-5/MSOP8
- Choice of Gains:
 - 20V/V (COSINA180A1)
 - 50V/V (COSINA180A2)
 - 100V/V (COSINA180A3)
 - 200V/V (COSINA180A4)

Applications

- Current Sensing
- Battery Charging and Discharging
- Overcurrent Protection
- Motor Control

General Description

The COSINA180 (single) and COSINA2180 (dual) are voltage output, current sense amplifiers (also called current shunt monitors) which can measure voltage across shunts at common-mode voltages from -0.3V to +25V, independent of supply voltage. The low offset of the zero-drift architecture enables current sensing across the shunt with maximum voltage drop as low as 10mV full-scale.

These devices can operate from a single +2.7V to +5.5 V power supply, drawing a typical 50μA of supply current, and are specified over the extended operating temperature range (-40°C to +125°C). The COSINAx180 family are commonly used for over-current protection, precision-current measurement for system optimization or in closed-loop feedback circuits.

3 Product Specification

3.1 Absolute Maximum Ratings (1)

Parameter	Min	Max	Unit
Supply Voltage, V_s		+26	V
Differential Analog Inputs, $(V_{IN+}) - (V_{IN-})$	-26	+26	V
Common Mode Analog Inputs, V_{IN+}, V_{IN-}	GND-0.3	+26	V
Output Voltage, V_{OUT}	GND-0.3	$V_s+0.3$	V
Maximum Output Current, I_{OUT}		8	mA
Maximum Junction Temperature, $T_{J(max)}$		+150	°C
Storage temperature, T_{STG}	-55	+150	°C

(1) Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

4 Application Information

The COSINA180, COSINA2180 current-sense amplifiers provide the fully differential input necessary to get accurate shunt connections, while also providing a built-in gain network with precision difficult to obtain with external resistors. The COSINAx180 series of devices can be configured for both low-side and high-side current sensing. While at times the application requires low-side sensing, only high-side sensing can detect a short from the positive supply line to ground. Furthermore, high-side sensing avoids adding resistance to the ground path of the load being measured. The application below focus primarily on high-side current sensing.

Figure 2 shows the basic connections of the COSINA180. The device amplify the voltage developed across a current-sensing resistor as current flows through the resistor to the load or ground. When the input signal increases, the output voltage at the OUT pin increases. For the best measurement accuracy, connect the input pins (IN+ and IN-) as close as possible to the shunt resistor to minimize any resistance in series with the shunt resistor.

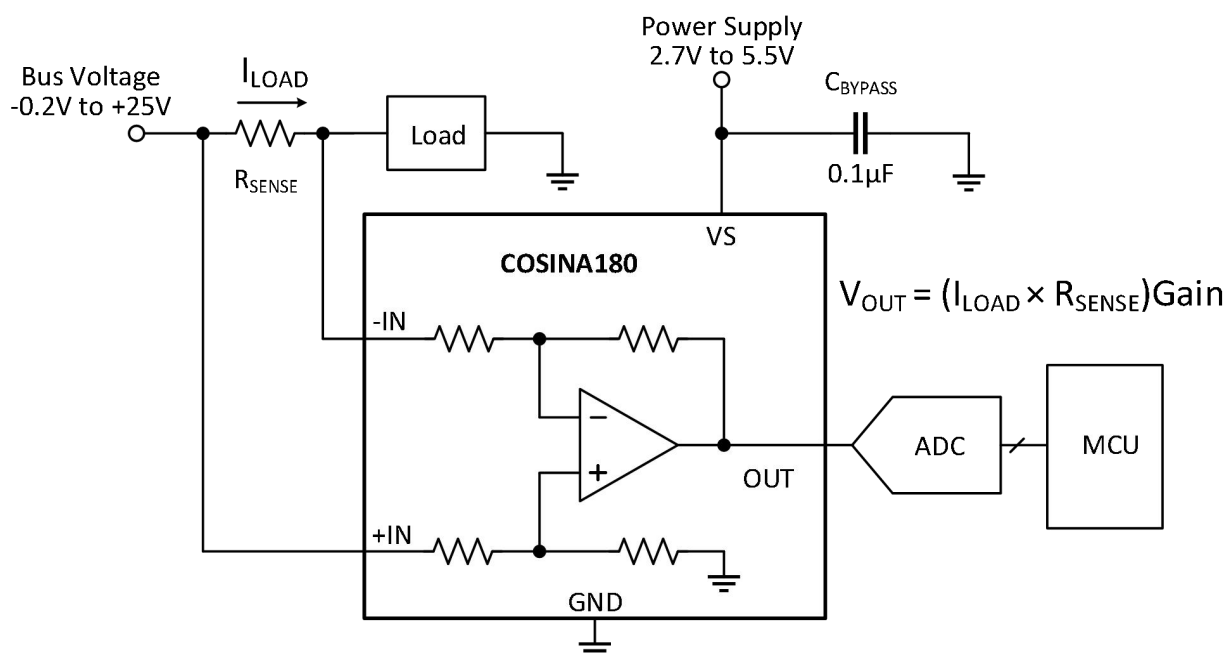

Figure 2 Typical Application Schematic

The desired accuracy of the current measurement determines the current-sensing resistor precision and value. The larger the resistor value, the more accurate the measurement possible, but a large resistor value also results in greater power loss. Therefore, using current-sense resistors larger than a few ohms is generally not recommended.

A typical non-zero-drift current shunt monitors typically require a full-scale range of 100 mV. The COSINAx180 zero-drift series gives equivalent accuracy at a full-scale range on the order of 10 mV. This accuracy reduces shunt dissipation by an order of magnitude with many additional benefits.

The input circuitry of the COSINAx180 can accurately measure beyond the power-supply voltage, $V+$. For example, the $V+$ power supply can be 5 V, whereas the load power-supply voltage can be as high as 25V. However, the output voltage range of the OUT pin is limited by the voltages on the power-supply pin. Note also that the COSINAx180 can withstand the full input signal range up to 25V at the input pins, regardless of whether the device has power applied or not.

A power-supply bypass capacitor of at least 0.1 μF is required for proper operation. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors as close as possible to the device pins.
