

# PART NUMBER

# ICL8049CCPE-ROCV

# Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All re-creations are done with the approval of the Original Component Manufacturer. (OCM)

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

# **Quality Overview**

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
  - Class Q Military
  - Class V Space Level

Qualified Suppliers List of Distributors (QSLD)

• Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OCM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

ICL8	049
------	-----

## **Antilog Amplifier**

July 1999

### Features

- Full Scale Accuracy.....0.5%
- Temperature Compensated Operation .... 0°C to 70°C
- Scale Factor, Adjustable ..... 1V/Decade
- Dynamic Voltage Range ......60dB
- Dual JFET Input Op Amps

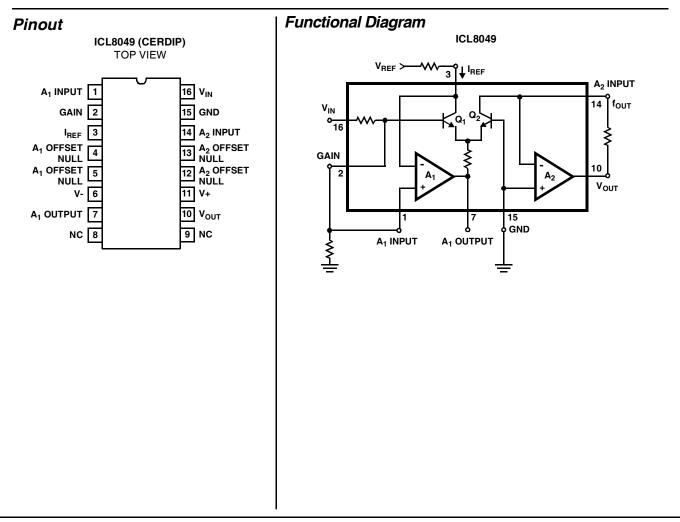

# Contact our Technical Support Center at contact our rechnical Support Center at 1-888-INTERSIL or www.intersil.com/tsc Description

The ICL8049 is a monolithic antilogarithmic amplifier that is fully temperature compensated and is nominally designed to provide 1 decade of output voltage for each 1V change of input voltage. For increased flexibility, the scale factor, reference current and offset voltage are externally adjustable.

## Part Number Information

PART NUMBER	ERROR (25°C)	TEMPERATURE RANGE (°C)	PACKAGE
ICL8049BCJE	10mV	0 to 70	16 Ld CERDIP
ICL8049CCJE	25mV	0 to 70	16 Ld CERDIP

NO RECOMMENDED REPLACEMENT OBSOLETE PRODUCT

CAUTION: These devices are sensitive to electrostatic discharge; follow proper IC Handling Procedures. 1-888-INTERSIL or 321-724-7143 | Intersil (and design) is a registered trademark of Intersil Americas Inc Copyright © Intersil Americas Inc. 2002. All Rights Reserved 1

### **Absolute Maximum Ratings**

Supply Voltage ±18V
$V_{\text{IN}}$ (Input Current)
I <sub>REF</sub> (Reference Current) 2mA
Voltage Between Offset Null and V+ ±0.5V
Output Short Circuit Duration Indefinite
Power Dissipation
Lead Temperature (Soldering 10 Sec.) 300°C

### **Operating Conditions**

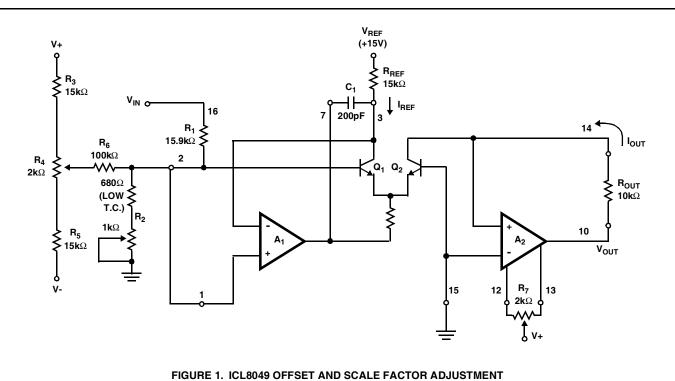

Operating Temperature Range	0°C to 70°C
Storage Temperature Range65	5°C to 150°C

Input Current) ±15\	/ Storage
(Reference Current) 2mA	1
age Between Offset Null and V+ ±0.5	/
ut Short Circuit Duration Indefinite	Э
er Dissipation	/
	~

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

#### ICL8049 Detailed Description

The ICL8049 relies on the same logarithmic properties of the transistor as the ICL8048. The input voltage forces a specific  $\Delta V_{BE}$  between  $Q_1$  and  $Q_2$  (Figure 1). This  $V_{BE}$  difference is converted into a difference of collector currents by the transistor pair. The equation governing the behavior of the transistor pair is derived from (2) on the previous page and is as follows:

$$\frac{{}^{I}C_{1}}{{}^{I}C_{2}} = \exp\left[\frac{q\Delta V_{BE}}{kT}\right]$$
(1)

When numerical values for q/kT are put into this equation, it is found that a  $\Delta V_{BE}$  of 59mV (at +25°C) is required to change the collector current ratio by a factor of ten. But for ease of application, it is desirable that a 1V change at the input generate a tenfold change at the output. The required input attenuation is achieved by the network comprising R<sub>1</sub> and R<sub>2</sub>. In order that scale factors other than one decade per volt may be selected, R<sub>2</sub> is external to the chip. It should have a value of 1kΩ, adjustable ±20%, for one decade per volt. R<sub>1</sub> is a thin film resistor deposited on the monolithic chip; its temperature characteristics are chosen to compensate the temperature dependence of Equation 1, as explained on the previous page.

The overall transfer function is as follows:

$$\frac{I_{OUT}}{I_{REF}} = \exp\left[\frac{-R_2}{(R_1 + R_2)} \times \frac{qV_{IN}}{kT}\right]$$
(2)

Substituting  $V_{OUT} = I_{OUT} \times R_{OUT}$  gives:

$$V_{OUT} = R_{OUT} I_{REF} \exp\left[\frac{-R_2}{(R_1 + R_2)} \times \frac{qV_{IN}}{kT}\right]$$
(3)

For voltage references Equation 3 becomes

$$v_{OUT} = v_{REF} \times \frac{R_{OUT}}{R_{REF}} \exp\left[\frac{-R_2}{(R_1 + R_2)} \times \frac{qV_{IN}}{kT}\right] \quad (4)$$

## ICL8049 Offset and Scale Factor Adjustment

As with the log amplifier, the antilog amplifier requires three adjustments. The first step is to null out the offset voltage of  $A_2$ . This is accomplished by reverse biasing the base-emitter of  $Q_2$ .  $A_2$  then operates as a unity gain buffer with a grounded input. The second step forces  $V_{IN} = 0$ ; the output is adjusted for  $V_{OUT} = 10V$ . This step essentially "anchors" one point on the transfer function. The third step applies a specific input and adjusts the output to the correct voltage. This sets the scale factor. Referring to Figure 1 the exact procedure for 1 decade/volt is as follows:

- 1. Connect the input (pin #16) to +15V. This reverse biases the base-emitter of  $Q_2$ . Adjust  $R_7$  for  $V_{OUT}$  = 0V. Disconnect the input from +15V.
- Connect the input to Ground. Adjust R<sub>4</sub> for V<sub>OUT</sub> = 10V. Disconnect the input from Ground.
- 3. Connect the input to a precise 2V supply and adjust  $R_2$  for  $V_{OUT} = 100mV$ .

The procedure outlined above optimizes the performance over a 3 decade range at the output (i.e.,  $V_{OUT}$  from 10mV) to 10V). For a more limited range of output voltages, for example 1V to 10V, it would be better to use a precise 1V supply and adjust for  $V_{OUT} = 1V$ . For other scale factors and/ or starting points, different values for  $R_2$  and  $R_{REF}$  will be needed, but the same basic procedure applies.
