

300mA Low Dropout Programmable output CMOS Voltage Regulators

■ General Description

The LN1139 series are highly precise, low noise, positive voltage LDO regulators manufactured using CMOS processes. The series achieves high ripple rejection and low dropout and consists of a standard voltage source, an error correction, current limiter and a phase compensation circuit plus a driver transistor. External output feedback, customers can easily get the required voltage. In order to make the load current does not exceed the current capacity of the output transistor, built-in over-current protection, over temperature protection and short circuit protection.

LN1139 may have the POWER GOOD indicator. When the FB voltage reaches 0.75V, PG output is high. When the FB drops below 0.7V, PG output is low. The internal op amp with advanced structure, the output capacitor can be omitted!

■ Features

■ Typical Application Circuit

Caution: The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant. $V_{out} = (1 + R_1/R_2) \times 0.8$, R_1 and R_2 must $> 100k\Omega$.
