

NH6375 Series Low Dropout Regulator

INTRODUCTION

The NH6675 series are a group of positive voltage regulators manufactured by CMOS technologies with low power consumption and low dropout voltage, which provide large output currents even when the difference of the input-output voltage is small. The NH6675 series can deliver 150mA output current and allow an input voltage as high as 50V. The series are very suitable for the battery-powered equipments, such as RF applications and other systems requiring a quiet voltage source.

DESIGNATOR	SYMBOL	DESCRIPTION
①	A B	Without EN With Shutdown Function
②	Integer	Output Voltage, e.g: 3.3V=33, 5.0V=50 12V=120
③	M/ MC/ MY MF/MR	Package: SOT-23-3 Package: SOT-23-5
④	- 1	2% Accuracy 1% Accuracy

FEATURES

- Low Quiescent Current: 3uA
- Operating Voltage Range: 2.5V~50V
- Output Current: 150mA
- Low Dropout Voltage:
- 500mV@50mA(VOUT=3.3V)
- Output Voltage: 1.2~ 12V
- High Accuracy: $\pm 2\%/\pm 1\%$ (Typ.)
- High Power Supply Rejection Ratio:
80dB@1kHz
- Low Output Noise:
27xV_{OUT} μ V_{RMS} (10Hz~100kHz)
- Excellent Line and Load Transient Response
- Built-in Current Limiter, Short-Circuit Protection
- Over-Temperature Protection
- Wireless Communication Equipments
- Portable Audio Video Equipments
- Car Navigation Systems
- LAN Cards
- Ultra Low Power Microcontroller

APPLICATIONS

- Cordless Phones
- Radio control systems
- Laptop, Palmtops and PDAs
- Single-lens reflex DSC
- PC peripherals with memory

THERMAL CHARACTERISTICS

Parameter	Symbol	Max.	Unit
Junction Temperature	T_j	-40 to +125	°C
Storage Temperature	T_{Stg}	-40 to +125	°C
Lead Temperature(Soldering, 10 sec)	T_{SOLDER}	260	°C

Note:

- Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltages are with respect to network ground terminal.
- ESD testing is performed according to the respective JEDEC standard. The human body model is a 100 pF capacitor discharged through a 1.5k resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

TYPICAL APPLICATION CIRCUIT

SELECTION OF INPUT/OUTPUT CAPACITORS

Phase compensation is provided to secure operation even when the load current is varied. For this purpose, use a 1.0uF or more output capacitor (C_{out}) with good frequency characteristics and proper ESR (Equivalent Series Resistance). Connect a 1.0uF or more input capacitor (C_{in}) between the V_{in} pin and the V_{ss} pin as close as possible to the pins. The value of the output overshoot or undershoot transient response varies depending on the value of the output capacitor. When selecting the output capacitor, perform sufficient evaluation, including evaluation of temperature characteristics on the actual device.

In the design of portable devices the ceramic capacitors are often chosen because of their small size, low equivalent series resistance (ESR) and high RMS current capability. Also designers have been looking to ceramic capacitors due to shortages of tantalum capacitors.

Unfortunately, using ceramic capacitors for input filtering can cause problems. Applying a voltage step to a ceramic capacitor causes a large current surge that stores energy in the inductances of the power leads. A large voltage spike is created when the stored energy is transferred from these inductances into the ceramic capacitor. These voltage spikes can easily be twice the amplitude of the input voltage step. (See "Ceramic Input Capacitors Can Cause Overvoltage Transients"—Linear Technology application note 88, March 2001)

Many types of capacitors can be used for input bypassing, however, caution must be exercised when using multilayer ceramic capacitors (MLCC). Because of the self-resonant and high Q characteristics of some types of ceramic capacitors, high voltage transients can be generated under some start-up conditions, such as connecting the LDO input to a live power source. Adding a 3 Ω resistor in series with an X5R ceramic capacitor will minimize start-up voltage transients.
